Reply to Dr Pickles query on use of feline or canine material in human medicines following report of a case of S.E. in a cat. 279

1. An analysis by MCA Professional staff of the returns to the questionnaire sent out to industry to obtain additional data about the use of animal materials of any origin in the manufacture of pharmaceutical products for human use, reveals that material of feline or canine origin is used in only two licensed products. In both instances the material is sourced from outside the U.K. and from areas currently believed to be free from B.S.E.

There are also licensed products and a CTX using material sourced from other animals which fall within the category of domestic pet. These are rabbit, mouse and Chinese hamster however, they are all sourced from BSE free areas.
